

Propagation from Stem Cuttings

John Bowen, Buncombe County Master Gardener Volunteer Gardening in the Mountains August 2020

NC STATE Extension Master Gardener

Asexual propagation – other techniques

- Leaf propagation (e.g. African violets, begonias)
- ٠ Root divisions
- Crown divisions or offsets ("digging plants") ٠
- Grafting, budding, stooling ٠

2

Rooting stem cuttings

- Softwood or semi-hard wood, greenwood, actively growing.
- Hardwood cuttings, dormant wood, usually over winter.

NC STATE Extension Master Gardener

The greenwood rooting process

- 1. Cut a stem
- 2. Dip in rooting hormone
- 3. Stick into rooting medium
- 4. Cover and maintain humidity
- 5. Wait patiently for roots
- 6. Pot up
- 7. Plant out

NC STATE Extension Master Gardener

Easy to Root				
Petunias	Salvias and Sages	Coleus		
Most herbaceous groundcovers	Begonias (wax and tuberous)	New Guinea Impatiens		
Caryopteris (Sirea)	Upright Fuchsia	Rosemary		
Roses	Red- and Yellow- twig dogwood	Hydrangea

Rooting Hormones

IBA powder

- Hormex, Miracle Gro, Garden-Safe, Hormodin, etc.
- Various strengths
- Inexpensive
- · Convenient and ready to use

NC STATE Extension Master Gardener

Where do roots form?

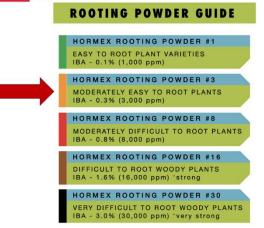

At the cut ends

In the internodes

NC STATE Extension Master Gardener

Rooting Hormones

Clonex

- IBA Gel with vitamins and minerals
- Single use packets and larger bottles

NC STATE Extension Master Gardener

Rooting Hormones

Dip 'n Grow

Master Gardener^{III} Voli

- IBA and NAA solution
- Dilute to working concentration

Rooting Hormones

Other options

- · Honey
- Cincerton
- Stick roses in portoes
- · Aspirt
- Willow stems in water sometimes

Rooting in Water?

- Coleus
- Salvia
- Mint
- Angel Wing
- Begonia
- Red Twig Dogwood
- Fuschia triphyla

Propagation media

Perlite : coconut coir 50:50 (Coconut coir can be purchased as loose bag or compressed brick. Use a name brand from a reputable supplier.)

Perlite : peat 50:50

Perlite alone (medium or smaller mesh)

Builder's sand (Coarse sand, not play sand. Locally, might be called all-purpose sand.)

Pine fines (Asheville Mulch Yard or Daddy Pete's Soil Conditioner)

No Fertilizer

Watering

Plants aren't transpiring and have no roots, so only maintain humidity. You should see condensation on the chamber or lid or dome.

Media should be damp. If you can wring water out of it, it's too wet. If using peat or coir, soak it to saturation, mix dry perlite with saturated peat/coir, and it should be about right.

Don't water again unless the media feels dry. Remember, you're just maintaining humidity, not watering plants.

Rooting Chambers

1. Media in Solo 10 oz (TP10). Cut two openings on bottom edge.

For tall cuttings, cover with 12 oz Solo cup or a 1 liter beverage bottle with bottom cut out. Take bottle lid on/off as needed for ventilation. One liter bottle will also fit inside many 4" square pots. I use those when rooting very tall cuttings, like roses.

Or

- 2. Place Solo 10 oz in a clear plastic bin. Lid need not be clear as long as good light comes through sides.
- 3. 1020 trays with 36 cell inserts and clear plastic cover.
- 4. Plastic bins with lids and drainage holes. Place media directly in bin.

Transition out of rooting mode. Some possible steps.

- A. Healthy tops, no mold. Go to 4"pot.
 - a. Indoors, just set under lights. Cover if roots are scanty. Move outdoors in shade in a week or so, then transition to sun.
 - b. Outdoors, pot in 4" and cover for a few days in shade, then remove cover. Re-cover if wilting. Transition to sun.
- B. Not healthy tops. Remove cover but leave in Solo Cup. Let top dry out for several days. Then pot up into 4".
- C. Fertilize with half strength in 4" if your potting media doesn't have fertilizer.
- D. When 4" is root-filled, usually move to gallon. Or if strong, plant into soil.

Overwinter

Stabilize. If they are hardy, bury them in chopped leaves, mulch or pine fines. Better in gallons than 4". But better in 4" than rushed into gallons. Should be fine over winter. Put on the north side. Or under a bush. Watch out for squirrels!

Tender perennials like petunias and impatiens will be indoors.

Shrubs and small trees

Viburnum, Hydrangea, Deutzia, Rose, Spirea, Rose of Sharon, Forsythia, Dogwood, Butterfly bush...

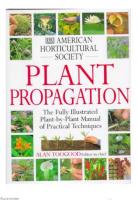

- 1. When: Dormancy—December
- 2. What to stick:
 - A. Younger plants do better
 - B. This year's growth
 - C. 3-node lengths, pencil diameter
- 3. Media: Same as greenwood or pine fines:perlite 50:50.
- 4. Cutting
 - A. 3-node pieces. Above and below nodes. Cut top to at angle.
- 5. Stick in pots.
 - A. Hormone. Use dibble. 2 nodes under, 1 above.
- 6. Where to place-2 schools
 - A. Outdoors in shade or semi-sun. Let it rain and freeze. Watch out for critters.
 - B. Indoors to protect against hard freezing. Unheated garage. Moist, not wet. Move into light when leaves appear.
- 7. How long:
 - A. Leaves should appear in the spring, but plants may take a full year to grow strong. I try to pot my cuttings up into gallons in mid summer, if possible.
